

Seunghoon (Sam) Jeon

Software Engineer · Bachelor of Computer Science

meregi7410@gmail.com | (+1) 425 866 9332 | [linkedin.com/in/sam-jeon](https://www.linkedin.com/in/sam-jeon) | github.com/Git-Mere |

TECHNICAL SKILLS

Languages: C/C++, C#, JavaScript, Python

Systems & OS: Linux Environment

Tools: Git, GitHub Actions, Docker, Azure, Linux CLI, REST APIs, MongoDB, CosmosDB, VS Code, Jira, Claude Code

WORK EXPERIENCE

Software Engineer, Tactical Affair

May 2026 – present

- Built a Python-based DMX512 stage lighting control system on Raspberry Pi with fixture abstraction, channel patching, and a **FastAPI** control server.
- Implemented validation rules and rate-limiting safety guards to **reliably detect and prevent invalid states**.
- Developed pytest unit tests for fixture modeling and protocol edge cases, applying root-cause analysis to mitigate latency.
- Designed layered tools and workflows separating ENTTEC USB framing from the DMX512 protocol, structuring the system for Unreal Engine integration.
- Leveraged Claude Code with RTK and Claude Team for AI-assisted development, accelerating implementation, debugging, and design review throughout the project.

Undergraduate Teacher Assistant, DigiPen Institute of Technology

Sep 2024 – present

- Maintained C++ assignments with unit tests and conducted code reviews to validate correctness, edge cases, and maintainability.
 - Assisted students in debugging programs by tracing execution paths and analyzing runtime issues across data flow, state transitions, and async behavior.
-

PROJECTS

Settle Up (Cloud-Based Receipt Settlement Application), School Project

Feb 2026 – May 2026

- Built a multi-service, event-driven receipt settlement platform integrating Discord, Azure Blob Storage, Event Grid, Cosmos DB, and **REST API** endpoints across services.
- Developed end-to-end user workflows for receipt upload, item assignment, and settlement confirmation, backed by persistent session state.
- Added logging, tracing, and metrics with OpenTelemetry to improve system debugging and reliability.

Still Reaching (Multiplayer Game Prototype), ThatGameJam

Dec 2025 – Jan 2026

- Collaborated with a game jam team to build an asynchronous, event-driven networking system using Godot's async/await and RPC, focused on non-blocking flow and reliable state management across clients.
 - Implemented session-based connection flows using Epic Online Services, handling lobby creation, room ID-based joins, and secure session lifecycle.
 - Implemented disconnect and rejoin handling to reliably detect and recover from invalid session states, maintaining consistent system behavior under network failure.
-

Activities

Software Engineer (Volunteer), Bighug (Non-Profit Organization)

Apr 2026 – Present

- Support mobile app development for helping Korean community in U.S.

Microdegree Contest (Hackathon), Keimyung University

- Won 2nd place and received a scholarship.
-

EDUCATION & AWARDS

Bachelor of Computer Science, DigiPen Institute of Technology, Year 3, GPA: **3.97/4.00**

Expected May 2027

- Relevant courses: Cloud Design, Multithreaded Programming, Database, Low-level Coding, Algorithms
